

COMPILATION EDITION

Beyond the Basics

The Mission Winning Magazine

Mission Winning to Read

v1.4.1 · <https://www.missionwinning.com>

Why we made this

In the early days of serious training culture, the best programs came with something to read — not just a plan to follow. The combination mattered: experience the work, and understand what the body is doing while you do it.

Mission Winning is built the same way. The app is where you train, fuel, move, recover, and track. This magazine is where you learn what adaptation is, how movement patterns work, how to tune volume and intensity, and how nutrition and sleep close the loop.

Plenty of people discover strength, recovery, and coaching through tools like this — and some go on to coach others or work in the industry. We want that curiosity to have a clear, evidence-based home.

Printed booklets are expensive to ship with every install. The web guide and this PDF keep the promise without the cost: free forever foundations, original Mission Winning wording, compiled from everything we have covered so far.

A deeper revised edition — with more biomechanics, corrective depth, and current practice — will come later. For now, this is the collection: Beyond the Basics. Mission Winning to Read.

Read and practice

Read a section when you want the why behind a lift, a macro target, or a deload.

When you see a practice line, open that route in the app and do one small action — log a set, complete a screen, or try a flow.

You can read start to finish, or jump to whatever you are stuck on. The app is the experience; this magazine is the reference.

All chapters

CH 01

HUMAN PERFORMANCE SCIENCE

How your body adapts — evidence over hype

CH 02

MOVEMENT MECHANICS

How lifts and patterns work — levers, not lore

CH 03

PROGRAMMING & TUNING

Volume, intensity, and when to deload — tune your plan

CH 04

GETTING STARTED WITH MISSION WINNING

I-Day, six pillars, and your Win Score

CH 05

NUTRITION & RECOVERY

Fuel and sleep — the other half of adaptation

CH 06

ASSESSMENTS & PROGRESS

Screen safely, benchmark honestly, adjust deliberately

Human Performance Science

How your body adapts — evidence over hype

Adaptation follows the demand you repeat

The SAID Principle

Your body adapts specifically to the stress you apply. Random workouts produce random results; intentional stress produces intentional gains.

Training works because of Specific Adaptation to Imposed Demands (SAID). When you squat repeatedly with progressive load, your nervous system, muscles, and connective tissue reorganize to handle that demand more efficiently.

This is why "muscle confusion" is oversold. Variation has a place — especially for joint health and skill — but the foundation is repeating key patterns while gradually increasing stress (weight, reps, quality, or range of motion).

Mission Winning tracks what you actually do. That history is the feedback loop: without logs, you are guessing whether adaptation is happening.

KEY IDEA

Adapt to the demand you repeat. Progress the same patterns — load, reps, quality, or range — before chasing novelty.

PRACTICE IN APP

Check readiness on Today — <https://www.missionwinning.com/log>

Energy Systems (Simple View)

Strength, intervals, and long steady work use different fuel pathways. Match your training intent to the system you want to develop.

You do not need a biochemistry degree to program well. Think in three buckets:

ATP-PC (seconds): Heavy singles, explosive jumps, short sprints. Full rest between efforts.

Glycolytic (30s–2min): Hard circuits, repeated 400m efforts, high-rep burnouts. Partial recovery.

Oxidative (minutes+): Jogging, long hikes, easy bike. Sustainable pace and breathing.

Most general fitness blends all three across the week. A lifter who never trains oxidative capacity may gas out on conditioning tests; a runner who never lifts may lack strength for posture and injury resilience. The six-pillar Win Score nudges balance — not perfection every day.

ENERGY SYSTEMS AT A GLANCE

SYSTEM	DURATION	FEEL	EXAMPLES
ATP-PC	Seconds	Max power, full rest	Heavy singles, jumps, short sprints
Glycolytic	30s–2 min	Hard burn, partial rest	Circuits, 400m repeats
Oxidative	Minutes+	Sustainable pace	Easy jog, hike, long bike

PRACTICE IN APP

Log an activity — <https://www.missionwinning.com/track>

Recovery Is Part of Training

Adaptation happens between sessions. Sleep, nutrition, and deload weeks are not optional extras.

Training provides the stimulus; recovery provides the adaptation window. Chronic under-recovery shows up as stalled lifts, irritability, poor sleep, and rising resting heart rate — not always as soreness.

Practical recovery levers you can control today: 7–9 hours sleep when possible, protein at most meals, hydration, easy movement on rest days (walks, mobility flows), and honest deloads when readiness rings trend down.

Readiness on the Today hub is a consistency score from your logs — not a medical device. Use it as a nudge to push, maintain, or back off — not as an excuse to skip forever.

RECOVERY IS TRAINING

The session is the stimulus; sleep, food, and easy movement are where adaptation lands. Treat under-recovery as a programming input — not a character flaw.

PRACTICE IN APP

Open health screen (PAR-Q) — <https://www.missionwinning.com/assessments>

Movement Mechanics

How lifts and patterns work — levers, not lore

Patterns over lore

The Squat Pattern

Knee and hip flexion with a braced torso. Depth and stance change muscle emphasis but the pattern stays the same.

Squatting is not "knees bad" or "ass to grass always." It is controlled hip and knee flexion with a stable spine.

Setup: Feet roughly shoulder width, toes slightly out, brace before you descend.

Descent: Hips and knees bend together; knees track over mid-foot (not collapsing inward).

Depth: Parallel or below if mobility and comfort allow. Partial reps have a place but are not a substitute for full-range strength.

Common mistakes: Heels lifting, excessive forward lean from weak ankles or poor brace, bouncing out of the hole.

Use the Library form guides and swap to goblet squats or box squats if barbell depth is not there yet.

Air squat — sit hips back, knees track, drive up

SQUAT FAULTS TO WATCH

- Heels lifting off the floor
- Knees collapsing inward
- Excessive forward lean from weak ankles or poor brace
- Bouncing out of the bottom without control

PRACTICE IN APP

Browse squat variations — <https://www.missionwinning.com/library>

The Hinge Pattern

Hip flexion and extension with minimal knee bend. Deadlifts, RDLs, and kettlebell swings share this blueprint.

The hinge loads the posterior chain: hamstrings, glutes, erectors. The bar or load stays close; the hips move back, not down like a squat.

Feel: Stretch in hamstrings at the bottom, glutes drive the lockout.

Common mistakes: Squatting the deadlift (knees shoot forward), rounding the lower back under load, hyperextending at lockout.

Romanian deadlifts and good mornings teach the hinge with lighter loads. Master the pattern before chasing maximal singles.

Hinge — hips back, bar close, drive to lockout

HINGE FAULTS TO WATCH

Squatting the deadlift — knees shoot forward instead of hips back

Rounding the lower back under load

Bar drifting away from the legs

Hyperextending the spine at lockout

PRACTICE IN APP

View hinge exercises — <https://www.missionwinning.com/library>

Push, Pull & Carry

Upper-body training organizes into pushing away, pulling toward, and loaded carries for real-world strength.

Push: Bench press, push-ups, overhead press — train horizontal and vertical angles. Keep shoulder blades engaged on presses.

Pull: Rows and pull-ups balance push volume and shoulder health. If you press often, pull at least as often.

Carry: Farmer walks, suitcase carries, and rucks build grip, core, and posture under load — underrated for general population clients.

Pair patterns across the week rather than cramming everything into one marathon session. The Builder and program templates encode sane splits for you.

Push pattern — brace, lower with control, press away

PATTERN BALANCE CHECK

Pull at least as often as you press

Train horizontal and vertical push/pull angles

Include at least one loaded carry weekly if equipment allows

Spread patterns across the week — not one marathon session

PRACTICE IN APP

Open workout Builder — <https://www.missionwinning.com/builder>

Programming & Tuning

Volume, intensity, and when to deload — tune your plan

Progress the plan, then deload

Volume & Intensity

Volume is how much work you do; intensity is how hard each set is. Both must progress over months, not every session.

Volume is often counted as hard sets per muscle group per week. Beginners grow on modest volume; advanced lifters need more careful periodization.

Intensity can mean % of max or proximity to failure (RPE). Heavy triples and moderate rep work serve different goals.

A common beginner mistake is maxing out every week. A common intermediate mistake is adding exercises instead of progressing the ones that matter.

Log sets and reps in Active Workout. Mission Winning history is your programming notebook.

Progress key lifts — log hard sets, not random add-ons

VOLUME LANDMARKS (HARD SETS / WEEK)

LEVEL	HARD SETS / MUSCLE / WEEK	INTENSITY CUE
Beginner	6–10	Leave 2–3 reps in reserve most sets
Intermediate	10–16	Mix RPE 7–9; progress one lift at a time
Advanced	12–20+	Periodize; deload when stalls cluster

PRACTICE IN APP

Start a workout — <https://www.missionwinning.com/active>

RPE & Auto-Regulation

Some days you have 90% of your best; training as if you always have 100% leads to burnout.

Rate of Perceived Exertion (RPE) scales how hard a set felt: RPE 8 means about two reps left. It lets you train hard without living at failure.

Use RPE when sleep was poor, stress is high, or readiness trends down. Keep the movement pattern; drop load or reps instead of forcing yesterday's numbers.

In the logger, note how sets felt. Over weeks you will see when to add weight versus when to repeat the same top set.

Same lift, honest RPE — progress without maxing every week

RPE QUICK REFERENCE

RPE	REPS IN RESERVE	USE WHEN
10	0 — failure	Rare max tests
9	1 left	Heavy strength sets
8	2 left	Default hard training
7	3 left	Technique / volume days
≤6	4+ left	Recovery / deload

PRACTICE IN APP

Use program templates — <https://www.missionwinning.com/builder>

Periodization & Deloads

Plans wave stress across weeks. Deloads are planned easier weeks — not failure.

Linear periodization: Add weight weekly on key lifts (works well for novices).

Undulating: Rotate heavy, moderate, and light days within the week.

Deload: Cut volume or intensity 40–60% for a week when performance stalls or readiness drops for 5+ days.

Program templates in the Builder encode these ideas. Pro templates (premium) add classic strength blocks — Texas Method, 5/3/1 variants, and more — when you are ready for structure beyond starters.

WHEN TO DELOAD

If key lifts stall for 2+ weeks, readiness trends down for 5+ days, or sleep and mood are clearly off — cut volume or intensity 40–60% for a week, then rebuild. Deload is a plan, not a failure.

PRACTICE IN APP

Browse templates — <https://www.missionwinning.com/builder>

Getting Started with Mission Winning

I-Day, six pillars, and your Win Score

Start the path — then show up daily

I-Day & Your Mission

Onboarding sets experience level, equipment, and goals so Today can recommend sensible next steps.

I-Day takes about three minutes: accept the mission, set your profile (level, equipment, goals), and optionally sign in for cloud sync.

You are not locked into one program forever. Open Welcome with ?edit=1 anytime equipment or goals change.

Journey phases — Basic Training, Readiness, Commissioned — exist to build habits across all six pillars, not just the barbell. Finish I-Day, then log one real session this week.

FIRST-WEEK ACTIONS

- Finish I-Day profile (level, equipment, goals)

- Log one Train session — even a short one

- Hit one Fuel or Move win on Today

- Revisit Welcome with ?edit=1 if equipment or goals change

PRACTICE IN APP

Review Welcome / I-Day — <https://www.missionwinning.com/welcome>

The Six Pillars

Train, Fuel, Move, Mind, Track, and Learn work together. Siloed apps miss the synergy.

Train — log sets and follow programs.

Fuel — macros, water, recipes.

Move — timed mobility flows.

Mind — breathing and short guided sessions.

Track — activities beyond the gym.

Learn — this guidebook and quick education paths.

Each pillar can log a win on Today. Basic Training asks for one win in each — a low bar meant to show the whole app, not exhaust you in week one.

SIX PILLARS — QUICK REFERENCE

PILLAR	WHAT YOU DO	ROUTE
Train	Log sets and programs	/active
Fuel	Macros, water, recipes	/nutrition
Move	Timed mobility flows	/move
Mind	Breathing and short sessions	/mind
Track	Runs, walks, activities	/track
Learn	Guidebook and quick paths	/learn

PRACTICE IN APP

Open Today hub — <https://www.missionwinning.com/log>

Win Score & Offline Use

Mission Score weights pillar consistency. The app works offline as a PWA once installed.

Win Score (Mission Score) is a holistic consistency metric — not a medical readiness grade. It rewards showing up across pillars over time more than one hero session.

Install from your browser (Add to Home Screen) for offline logging at the park or garage gym. Sync when you sign in on Profile.

Beta testers: see /beta for the start guide and feedback channels.

SCORE IS FEEDBACK

Win Score rewards consistency across pillars — not a single hero workout. Use it to notice gaps, not to punish a quiet week.

PRACTICE IN APP

Beta start guide — <https://www.missionwinning.com/beta>

Nutrition & Recovery

Fuel and sleep — the other half of adaptation

Recovery is part of training

Macros Without Obsession

Protein, carbohydrates, and fats each play a role. Track enough to learn, not enough to dread meals.

Protein: Roughly 1.6–2.2 g/kg bodyweight for most active people building or retaining muscle. Spread it across meals when you can.

Carbs: Fuel hard training and recovery; timing matters more for competitive athletes than for general fitness.

Fats: Essential for hormones and satiety — do not zero them out chasing low numbers.

Log a typical day on Fuel. Free recipes cover the basics; premium adds meal-prep depth when you want it.

PRIORITY ORDER

Hit protein first, then overall calories, then carbs around hard training. Fats fill the rest — do not zero them out.

PRACTICE IN APP

Open Fuel log — <https://www.missionwinning.com/nutrition>

Hydration & Sleep

Water and sleep move the needle more than most supplements.

Dehydration cuts performance and recovery. Drink steadily through the day, and a bit more around training.

Sleep is when recovery hormones and motor learning consolidate — including today's lifts. Chronic five-hour nights undermine every program, no matter how good the spreadsheet looks.

Mind includes wind-down sessions; Move includes recovery flows. Use them on rest days instead of another grind session.

Easy movement and holds count as recovery work

RECOVERY BASICS

Drink steadily through the day; extra around training

Aim for 7–9 hours sleep when life allows

Use Move recovery flows or Mind wind-downs on rest days

Treat chronic short sleep as a programming problem, not a willpower test

PRACTICE IN APP

Try a recovery flow — <https://www.missionwinning.com/move>

Meal Timing & Consistency

Total daily intake matters most; timing is a tiebreaker for advanced athletes.

For most users, hitting protein and calories across the day beats obsessing over a narrow "anabolic window."

Pre-workout: easily digested carbs plus protein if training fully fasted feels bad.

Post-workout: protein and carbs within a few hours supports recovery — not a minute-by-minute emergency.

Use Fuel recipes to pre-fill macros when planning is hard. Weekly challenges can nudge protein-day streaks.

AROUND-WORKOUT HABITS

Hit daily protein and calories first — timing is a tiebreaker

If fasted training feels bad, add easy carbs + protein beforehand

Eat protein and carbs within a few hours after hard sessions

Use Fuel recipes to pre-fill macros when planning is hard

PRACTICE IN APP

Browse recipes — <https://www.missionwinning.com/nutrition>

Assessments & Progress

Screen safely, benchmark honestly, adjust deliberately

Measure to adjust — not to shame

PAR-Q & Health Screening

Know when to seek medical clearance before pushing intensity.

The Physical Activity Readiness Questionnaire (PAR-Q) flags cardiovascular, joint, and metabolic risk flags. A "yes" does not mean never train — it means talk to a qualified professional before you load intensity.

Complete the in-app health screen honestly. Mission Winning is a civilian fitness tool, not medical advice.

Assessments save a summary to your log for your own reference — share with your doctor or coach if useful.

SCREEN BEFORE YOU LOAD

A yes on the readiness screen means get clearance — not never train. Honesty here protects intensity later.

PRACTICE IN APP

Complete PAR-Q — <https://www.missionwinning.com/assessments>

Benchmarks & Tests

Push-ups, pull-ups, and strength standards give objective checkpoints beyond the mirror.

Benchmark tests belong every few weeks — not every session. They answer a simple question: is training transferring to performance?

Use Readiness tests and history trends together. One bad day is noise; four weeks flat is signal.

Leaderboards add optional social motivation. Squad codes let friends compare without posting publicly.

Retest bodyweight benchmarks every 3–4 weeks

WHAT TO RETEST AND WHEN

CHECK	CADENCE	SIGNAL
Bodyweight benchmarks	Every 3–4 weeks	Rep PRs or clean form at same reps
Key lift e1RM / heavy set	Every 4–6 weeks	Load up with solid RPE 8–9
Readiness trend	Weekly glance	Multi-day downtrend → deload cue
One bad session	Ignore as noise	Do not rewrite the whole plan

PRACTICE IN APP

Open benchmarks — <https://www.missionwinning.com/benchmarks>

When to Adjust the Plan

Stall, pain, or life stress each call for different fixes — not always "push harder."

Stall: Add volume or intensity on one lift at a time, or deload and rebuild.

Pain: Sharp or joint pain — stop the aggravating movement and seek qualified help. Dull muscle soreness after hard work is different.

Life stress: Keep the habit with lower-RPE sessions; consistency beats hero weeks you cannot recover from.

History and Win Score trends on Today help you decide. This guidebook is the reference; your log is the truth.

STALL VS PAIN VS STRESS

Stall → progress one lift or deload. Sharp joint pain → stop and refer out. Life stress → keep the habit at lower RPE. Do not treat every bad week as a cue to push harder.
